

Questionnaire: Live VR Interaction Label

Participant Response Sheet – VR Developers / Expert

Participant facing copy. Use the scale shown unless the question has its own answer choices.

In this questionnaire, the tool refers to the live label shown during gameplay. The post gameplay frequency report refers to the frequency of the detected issues captured during the entire gameplay session.

Section 1 - VR Interaction Usability

1. The live label was clear during gameplay. I could tell what it referred to and what status it was showing.

Choose one: 4 Agree

2. The live label helped me understand what the VR application expected me to do.

Choose one: 4 Agree

3. The live label helped me notice when an interaction needed attention.

Choose one: 4 Agree

4. The live label helped me tell whether my action matched the visual cues and VR app response.

Choose one: 4 Agree

5. The live label helped me adjust or recover when something went wrong.

Choose one: 5 Strongly agree

6. The live label would help me reproduce or explain an interaction issue later so that the issue can be tested again more consistently.

Choose one: 5 Strongly agree

Section 2 - Developer Feedback

7. The post gameplay frequency report accurately reflected how often issues occurred during my session.

Choose one: 3 Neutral / not sure

8. The post gameplay frequency report would help rank or prioritize issues based on how often they occurred, how long they persisted, or how much of the session they affected.

Choose one: 3 Neutral / not sure

9. The live label would provide enough information to create or update a bug report.

Choose one: 4 Agree

10. The live label could support automated or semi-automated review by flagging issues or moments that need human inspection.

Choose one: 4 Agree

11. Overall, the tool was accurate enough to be useful for VR testing.

Choose one: 4 Agree

Section 3 – Safety, Body Tracking and Movement Feedback

For this section: body location means where spatially the user/avatar is positioned in the virtual scene; body orientation means which way the user/avatar is facing; posture means the body pose or stance; movement symmetry means whether left and right movements appear balanced; floor/ground plane means the expected virtual floor/ground height reference.

12. The live label could help evaluate whether an issue is related to interaction behavior, body tracking, or user safety.

Choose one: 2 Disagree

13. It would be useful to know whether missing, unstable, or poorly tracked body parts affected the label.

Choose one: 3 Neutral / not sure

14. It would be useful to know whether the user's body location or occupied space in the scene affected the label.

Choose one: 5 Strongly agree

15. It would be useful to know whether the user's body orientation or posture affected the label.

Choose one: **5 Strongly agree**

16. It would be useful to know whether the user's relationship to the floor or ground plane affected the label.

Choose one: **2 Disagree**

17. The live label would help give users feedback before unsafe or excessive movement is repeated.

Choose one: **5 Strongly agree**

Section 4 - Open-Ended Review

18. VR Application tested:

All

19. What interaction elements were specific to this VR app?

Movement of limbs (arms/legs); full body movement would affect your position in the game

20. What did you notice that stayed the same across VR apps, and what changed between VR apps?

All games involved the use of the full body. For the war and sea games, it was more important to move from side to side, and for the puzzle and archery games, the position of your hands was more significant.

21. How did a failure case appear in this game? For example, was there a missing action, delayed response, incorrect object selection, unsafe movement, or unclear feedback?

The puzzle game often moved a tile that my hand wasn't touching, even when the green indicator showed where my hand's position was.

22. Describe one moment where the live label helped you understand, recover from, or review an interaction.

In the piano tiles game, when the tiles were not disappearing, I realized I needed to move my legs closer to the camera. Once the tiles disappeared, I learned the pattern.

23. What information should be logged with each label to make it more actionable for debugging, safety, body tracking, or interaction review?

2D distance of player from edges of screen (top of head/fingertips), maybe coordinate of the origin of the player
