

Questionnaire: Live VR Interaction Label (Cross App)

Participant Response Sheet - VR Users

Participant facing copy. Use the scale shown unless the question has its own answer choices.

In this questionnaire, the tool refers to the live label shown during gameplay. The post gameplay frequency report refers to the frequency of the detected issues captured during the entire gameplay session.

Section 1 - VR Interaction Usability

1. The live label was clear during gameplay. I could tell what it referred to and what status it was showing.

Choose one: 4 Agree

2. The live label helped me understand what the VR application expected me to do.

Choose one: 4 Agree

3. The live label helped me notice when an interaction needed attention.

Choose one: 5 Strongly agree

4. The live label helped me tell whether my action matched the visual cues and VR app response.

Choose one: 5 Strongly agree

5. The live label helped me adjust or recover when something went wrong.

Choose one: 5 Strongly agree

6. The live label would help me explain an interaction issue later.

Choose one: 4 Agree

Section 2 - Safety and Movement Feedback

7. The live label helped me notice when my movement might be unsafe, uncomfortable, or outside the expected range.

Choose one: 5 Strongly agree

8. The live label would help me avoid pushing beyond a safe range of motion during physical VR tasks.

Choose one: 5 Strongly agree

9. The live label would make me feel more confident if the VR app could warn me as soon as possible before I (repeatedly) perform an unsafe or incorrect movement.

Choose one: 5 Strongly agree

10. The live label would be more useful if it also explained why the movement was unsafe or incorrect.

Choose one: 5 Strongly agree

Section 3 - Tool Feedback

11. The post-gameplay frequency report accurately reflected how often issues occurred during my session.

Choose one: 5 Strongly agree

12. Overall, the tool was accurate enough to be useful during VR gameplay.

Choose one: 5 Strongly agree

Section 4 - Open-Ended Review

13. VR Application tested:

Archery, War, Sea, Piano Tiles, Phantom Limb, Puzzle

14. What interaction elements or visual cues were specific to this VR app?

Puzzle was notably different because it allowed the user to move front, where part of the body is out of frame. But it was not breaking the game mechanics.

15. What did you notice that stayed the same across VR apps, and what changed between VR apps?

Staying in the frame of the camera was the same across apps. If you went too far to either side the live label appeared. What changed was the expected motion of the limbs. Some games needed you to move limbs in some directions, while in other games that would break the game mechanics. Notably in the Puzzle game we could go off screen without the live label appearing.

16. Describe one moment where the live label helped you understand, recover from, or review an interaction. If there was a failure case, how did it appear in this VR app?

When I was too close to the screen, the live label indicated that there was an incorrect interaction which prompted me to move further back, which resolved the live label and allowed the game to play better.

17. Describe any moment where the label could have helped you avoid overreaching, stretching too far, or repeating an uncomfortable movement.

In the War game, stretching your limbs too far to the bottom left or bottom right would cause the live label to appear. This makes you avoid overreaching.

18. Overall, how useful was the live label?

Choose one: 5 Extremely useful
